

Foul weather friend.

How Whittaker Plastisol XL blends beauty and protection in one coating.

Metal coatings won't last long in salt air or corrosive chemical atmospheres. Unless you start with Whittaker Plastisol XL.

Revolutionary solution.

Plastisol XL protects metal from the worst man-made and natural environments. Beautifully. For decades.

Plastisol XL is a carefully-formulated dispersion of polyvinyl chloride in a plasticizer base. It's tough. It's available in ten attractive colors and film thickness from four to nine mils. And it's a far cry from the heavy-film-build metal cladding you may be using now.

Whittaker, of course.

There is only one complete line of premium coatings for architectural metals. And it's from the only name you need to know in coatings.

Whittaker.
Of course.

Expect more from us.

Whittaker
