Has she come from some orbiting space ship? From another dimension? Another time? She could have. She stands in a perfect cylinder, smooth and round. Is it light? Or, is it pure energy?

Exclusive to Precision Projection Systems, this is an extraordinary interpretation of the teleportation effect popularized in contemporary science fiction.

Although many light technologists have attempted to create this effect for the stage or permanent installation, most have found it impossible to achieve a true, smooth-sided cylinder – rather than a cone – of light.

Here, the model is standing underneath a sophisticated assembly made up of a high-speed scanner, a computer-controlled color modulator, and a specially designed large optical element which directs light down to the floor. The system allows computer control of the color and pattern of the cylinder walls as well as the direction and speed of motion. The effect is stunning, and unlike anything else you've seen.

Shall we take you to a higher level?

Precision Projection Systems has developed laser-based effects for some of the most important names in the domestic and international entertainment industry. We pride ourselves in innovative, practical and cost-effective approaches that make lasers and light a dramatic and dependable element in road shows and permanent installations.

Don't you think it's time we got to know each other better?
