In her hands, a pair of wands – wands that pulse with dynamic energy. They look alive, constantly changing: animated light, first manic and wild, then docile and calm. Unbelievable! But still...you see it with your own eyes.

Pioneering their development nearly five years ago, fiber optic laser effects are a particular specialty of Precision Projection Systems. It is an expertise that makes possible innovative effects such as the energy wands.

Not at all static, the energy wands use fiber optic bundles to create the illusion of pulsating energy moving through a conduit. The compact size of the scanner used in this effect allows for flexible placement, making it appropriate for permanent installations as well as for manual effects such as the wands shown here.

Unlike conventional – and much bulkier – projection techniques, the Precision Projection Systems effect is a far more intense and precisely controllable form of animation. Moreover, it is completely safe, easily programmed and maintained, and exceptionally cost-efficient.

What more could you ask?

Precision Projection Systems has developed laser-based effects for some of the most important names in the domestic and international entertainment industry. We pride ourselves in innovative, practical and cost-effective approaches that make lasers and light a dramatic and dependable element in road shows and permanent installations.

Don't you think it's time we got to know each other better?
